

SCENARIOS AND SOLUTIONS FOR DIGITAL ECONOMY DEVELOPMENT IN DAK LAK PROVINCE TOWARDS 2030

Abstract:

This paper investigates the scenarios and solutions for digital economy development in Dak Lak province up to 2030, contextualized within the inter-regional geo-economic merger with Phu Yen province. By integrating macro-methodology (the extended Cobb-Douglas production function and Leontief coefficients from Input-Output tables) and micro-analysis (OLS Robust regression model on 7,051 enterprises), the study reveals a structural imbalance in Dak Lak digital economy: the core ICT digital economy only accounts for 2.43% of the GRDP, while key sectors like agriculture and logistics have digital penetration rates below 10%. Quantitative results confirm that the natural growth scenario will lag behind strategic objectives. Therefore, the paper proposes adopting a breakthrough scenario, aiming for the digital economy to constitute 30.36% of the GRDP (equivalent to 141,229 billion VND) by 2030, requiring a growth acceleration of 40.71%/year. To realize this trajectory, the study establishes a matrix of four strategic solutions: achieving breakthroughs in core ICT infrastructure, promoting the "digital spillover effect" into real production, upgrading data-driven e-government, and providing "seed finance" to remove software cost barriers for enterprises.
